## **SQL Cheat Sheet: FUNCTIONS and Implicit JOIN**

| Command             | Syntax (MySQL/DB2)  | Description  | Example (MySQL/DB2)  |
|---------------------|---|--|--|
| COUNT               | SELECT COUNT(column_name) FROM table_name WHERE condition;  | COUNT function returns the number of rows that match a specified criterion.  | SELECT COUNT(dep_id) FROM employees;   |
| AVG                 | SELECT AVG(column_name) FROM table_name WHERE condition;  | AVG function returns the average value of a numeric column.  | SELECT AVG(salary) FROM employees;   |
| SUM                 | <pre>SELECT SUM(column_name) FROM table_name WHERE condition;</pre>   | SUM function returns the total sum of a numeric column.  | SELECT SUM(salary) FROM employees;   |
| MIN                 | <pre>SELECT MIN(column_name) FROM table_name WHERE condition;</pre>   | MIN function returns the smallest value of the SELECTED column.  | SELECT MIN(salary) FROM employees;   |
| MAX                 | <pre>SELECT MAX(column_name) FROM table_name WHERE condition;</pre>   | MAX function returns the largest value of the SELECTED column.   | SELECT MAX(salary) FROM employees;   |
| ROUND               | SELECT ROUND(2number, decimals, operation) AS RoundValue;   | ROUND function rounds a number to a specified number of decimal places.  | SELECT ROUND(salary) FROM employees;   |
| LENGTH              | <pre>SELECT LENGTH(column_name) FROM table;</pre>   | LENGTH function returns the length of a string (in bytes).   | <pre>SELECT LENGTH(f_name) FROM employees;</pre>   |
| UCASE               | <pre>SELECT UCASE(column_name) FROM table;</pre>  | UCASE function displays the column name in each table in uppercase.  |  |
| LCASE               | <pre>SELECT LCASE(column_name) FROM table;</pre>  | LCASE function displays the column name in each table in lowercase.  |  |
| DISTINCT            | SELECT DISTINCT column_name FROM table;   | DISTINCT function is used to display data without duplicates.  | SELECT DISTINCT UCASE(f_name) FROM employees;  |
| DAY                 | SELECT DAY(column_name) FROM table  | DAY function returns the day of the month for a given date.  | <pre>SELECT DAY(b_date) FROM employees where emp_id = 'E1002';</pre>                                     |
| CURRENT_DATI        | ∃ SELECT CURRENT_DATE;  | CURRENT_DATE is used to display the current date.  | SELECT CURRENT_DATE;   |
| DATEDIFF()          | SELECT DATEDIFF(date1, date2);  | DATEDIFF() is used to calculate the difference<br>between two dates or time stamps. The default<br>value generated is the difference in number of<br>days.   | <pre>SELECT DATEDIFF(CURRENT_DATE, date_column) FROM table;</pre>  |
| FROM_DAYS()         | <pre>SELECT FROM_DAYS(number_of_days);</pre>  | FROM_DAYS() is used to convert a given number of days to YYYY-MM-DD format.  | <pre>SELECT FROM_DAYS(DATEDIFF(CURRENT_DATE, date_column)) FROM table;</pre>                             |
| DATE_ADD()          | <pre>SELECT DATE_ADD(date, INTERVAL n type);</pre>  | DATE_ADD() is used to calculate the date after lapse of mentioned number of units of date type, i.e. if n=3 and type=DAY, the result is a date 3 days after what is mentioned in date column. The type valiable can also be months or years.               | <pre>SELECT DATE_ADD(date, INTERVAL 3 DAY);;</pre>   |
| DATE_SUB()          | <pre>SELECT DATE_SUB(date, INTERVAL n type);</pre>  | DATE_SUB() is used to calculate the date prior to the record date by mentioned number of units of date type, i.e. if n=3 and type=DAY, the result is a date 3 days before what is mentioned in date column. The type valiable can also be months or years. | <pre>SELECT DATE_SUB(date, INTERVAL 3 DAY);;</pre>   |
|                     | SELECT column_name [, column_name ] FROM  | Subquery is a query within another SQL query and embedded within the WHERE clause.   | SELECT emp_id, f_name, l_name, salary FROM employees where salary < (SELECT AVG(salary) FROM employees); |
| Subquery            | table1 [, table2 ] WHERE column_name OPERATOR (SELECT column_name [, column_name ] FROM table1 [, table2 ] [WHERE]) | A subquery is used to return data that will be used in the main query as a condition to further restrict the data to be retrieved.   | <pre>SELECT * FROM ( SELECT emp_id, f_name, l_name, dep_id FROM employees) AS emp4all;</pre>             |
|                     |   |  | SELECT * FROM employees WHERE job_id IN (SELECT job_ident FROM jobs);                                    |
| Implicit Inner Join | SELECT column_name(s) FROM table1, table2 WHERE table1.column_name = table2.column_name;                            | Implicit Inner Join combines two or more records but displays only matching values in both tables. Inner join applies only the specified columns.  | SELECT * FROM employees, jobs where employees.job_id = jobs.job_ident;                                   |
| Implicit Cross Join | n SELECT column_name(s) FROM table1, table2;  | Implicit Cross Join is defined as a Cartesian product where the number of rows in the first table is multiplied by the number of rows in the second table.   | SELECT * FROM employees, jobs;   |
